MP15DC Step Set - Atlas Model

These steps are designed to be used on an Atlas MP15 DC Model. While they were designed to be used on an undecorated model, they can be used on a pre-decorated model. The illustrations on the back of this sheet show how the parts should look after bending to shape and ready to install.

Carefully remove plastic corner steps from each corner of the sill unit/frame. Leave a small lip on each edge to mount the new brass steps on,

Remove brass steps from fret, one at a time, and form to shape. Bend outer/front edge of step down 90 degrees at the score line (score lines are the inside of the bend). The kick plate on the back of each step bends up 90 degrees in the opposite direction of the front lip. Position step in correct corner and position so it rest on the small lips left from the old steps. Glue in place when satisfied with placement.

The cab steps have two mounting pins that need to be retained when trimming from fret. Bend front lip down 90 degrees, insert pins in holes and glue in place. IF you are working on a model with these steps glued in place, carefully remove old steps, leaving a small lip. Remove pins from brass steps and glue step in place of old plastic step. Touch up paint if needed.

Thank you for using our product on your model. Visit our web site for all of the photo etch detail products we have available.

<<< Parts as packaged. Trim steps from fret. The fret is the shaded area shown and is discarded.
